A

Alimentary tract and metabolism

ATC2: 84 classes

A10

Drugs used in diabetes

A10B

Blood glucose lowering drugs

A10BA

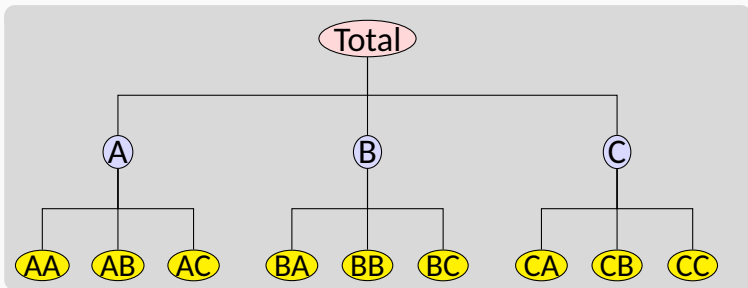

Biguanides

A10BA02

Metformin

Hierarchical time series

A **hierarchical time series** is a collection of several time series that are linked together in a hierarchical structure.

Hierarchical time series

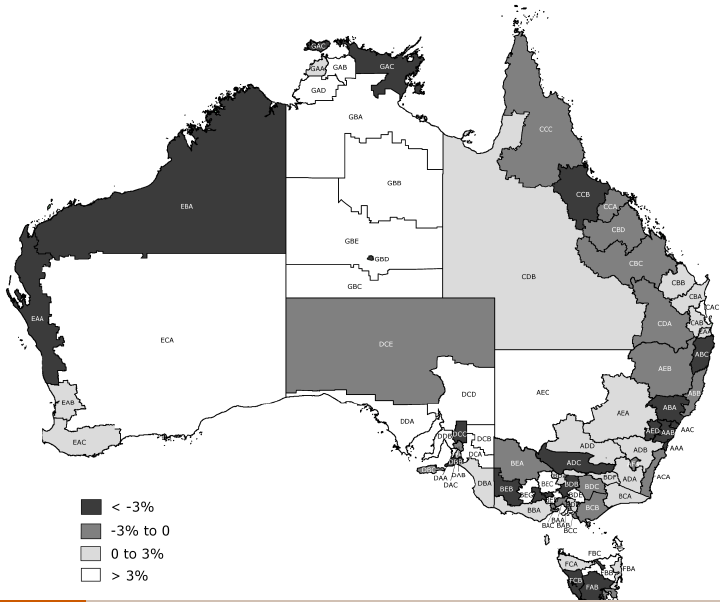

A **hierarchical time series** is a collection of several time series that are linked together in a hierarchical structure.

Examples

- PBS sales by ATC groups
- Tourism demand by states, zones, regions

Australian tourism

Australian tourism

```
tourism
```

```
## # A tsibble: 24,320 x 5 [1Q]
```

```
## # Key:           Region, State, Purpose [304]
```

##	Quarter	Region	State	Purpose	Trips
##	<qtr>	<chr>	<chr>	<chr>	<dbl>
##	1 1998 Q1	Adelaide	South Australia	Business	135.
##	2 1998 Q2	Adelaide	South Australia	Business	110.
##	3 1998 Q3	Adelaide	South Australia	Business	166.
##	4 1998 Q4	Adelaide	South Australia	Business	127.

Australian tourism

- Quarterly data on visitor night from 1998:Q1 – 2013:Q4
- From: *National Visitor Survey*, based on annual interviews of 120,000 Australians aged 15+, collected by Tourism Research Australia.
- Split by 7 states, 27 zones and 76 regions (a geographical hierarchy)
- Also split by purpose of travel
 - ▶ Holiday
 - ▶ Visiting friends and relatives (VFR)
 - ▶ Business
 - ▶ Other
- 304 bottom-level series

Grouped time series

A **grouped time series** is a collection of time series that can be grouped together in a number of non-hierarchical ways.

Grouped time series

A **grouped time series** is a collection of time series that can be grouped together in a number of non-hierarchical ways.

Examples

- Tourism by state and purpose of travel
- Retail sales by product groups/sub groups, and by countries/regions

Creating aggregates

```
PBS %>%  
  aggregate_key(ATC1/ATC2, Scripts = sum(Scripts)) %>%  
  filter(Month == yearmonth("1991 Jul")) %>% print(n=18)

## # ... with 410 more rows
```

Creating aggregates

- Similar to summarise() but using the key structure
- A grouped structure is specified using grp1 * grp2
- A nested structure is specified via parent / child.
- Groups and nesting can be mixed:

```
(country/region/city) * (brand/product)
```

- All possible aggregates are produced.
- These are useful when forecasting at different levels of aggregation.

Outline

- 1 Hierarchical and grouped time series
- 2 Forecast reconciliation
- 3 Example: Australian tourism
- 4 Lab Session 10

The problem

- 1 How to forecast time series at all nodes such that the forecasts add up in the same way as the original data?
- 2 Can we exploit relationships between the series to improve the forecasts?

The problem

- 1 How to forecast time series at all nodes such that the forecasts add up in the same way as the original data?
- 2 Can we exploit relationships between the series to improve the forecasts?

The solution

- 1 Forecast all series at all levels of aggregation using an automatic forecasting algorithm.
(e.g., ETS, ARIMA, ...)
- 2 Reconcile the resulting forecasts so they add up correctly using least squares optimization (i.e., find closest reconciled forecasts to the original forecasts).
- 3 This is available using `reconcile()`.

Forecast reconciliation

```
tourism %>%  
  aggregate_key(Purpose*(State/Region), Trips=sum(Trips)) %>%  
  model(ets = ETS(Trips)) %>%  
  reconcile(ets_adjusted = min_trace(ets)) %>%  
  forecast(h = 2)
```

```
## # A tibble: 1,700 x 7 [1Q]
```

```
## # Key:   Purpose, State, Region, .model [850]
```

	Purpose	State	Region	.model	Quarter	Trips

## 8	Business	New South~	Capital C~	ets	2018 Q2	36.1

Hierarchical and grouped time series

Every collection of time series with aggregation constraints can be written as

$$\mathbf{y}_t = \mathbf{S}\mathbf{b}_t$$

where

- \mathbf{y}_t is a vector of all series at time t
- \mathbf{b}_t is a vector of the most disaggregated series at time t
- \mathbf{S} is a “summing matrix” containing the aggregation constraints.

Hierarchical time series

Hierarchical time series

y_t : observed aggregate of all series at time t .

$y_{X,t}$: observation on series X at time t .

b_t : vector of all series at bottom level in time t .

Hierarchical time series

y_t : observed aggregate of all series at time t .

$y_{X,t}$: observation on series X at time t .

b_t : vector of all series at bottom level in time t .

$$\mathbf{y}_t = \begin{pmatrix} y_t \\ y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix}$$

Hierarchical time series

y_t : observed aggregate of all series at time t .

$y_{X,t}$: observation on series X at time t .

b_t : vector of all series at bottom level in time t .

$$\mathbf{y}_t = \begin{pmatrix} y_t \\ y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix} = \underbrace{\begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}}_S \underbrace{\begin{pmatrix} y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix}}_{b_t}$$

$$\mathbf{y}_t = S \mathbf{b}_t$$

Forecasting notation

Let $\hat{\mathbf{y}}_n(h)$ be vector of initial h -step forecasts, made at time n , stacked in same order as \mathbf{y}_t .

Forecasting notation

Let $\hat{\mathbf{y}}_n(h)$ be vector of initial h -step forecasts, made at time n , stacked in same order as \mathbf{y}_t .
(In general, they will not “add up”.)

Forecasting notation

Let $\hat{\mathbf{y}}_n(h)$ be vector of initial h -step forecasts, made at time n , stacked in same order as \mathbf{y}_t .
(In general, they will not “add up”.)

Reconciled forecasts must be of the form:

$$\tilde{\mathbf{y}}_n(h) = \mathbf{S}\mathbf{G}\hat{\mathbf{y}}_n(h)$$

for some matrix \mathbf{G} .

Forecasting notation

Let $\hat{\mathbf{y}}_n(h)$ be vector of initial h -step forecasts, made at time n , stacked in same order as \mathbf{y}_t .
(In general, they will not “add up”.)

Reconciled forecasts must be of the form:

$$\tilde{\mathbf{y}}_n(h) = \mathbf{S}\mathbf{G}\hat{\mathbf{y}}_n(h)$$

for some matrix \mathbf{G} .

- \mathbf{G} extracts and combines base forecasts $\hat{\mathbf{y}}_n(h)$ to get bottom-level forecasts.
- \mathbf{S} adds them up

Optimal combination forecasts

Main result

The best (minimum sum of variances) unbiased forecasts are obtained when $\mathbf{G} = (\mathbf{S}'\Sigma_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\Sigma_h^{-1}$, where Σ_h is the h -step base forecast error covariance matrix.

Optimal combination forecasts

Main result

The best (minimum sum of variances) unbiased forecasts are obtained when $\mathbf{G} = (\mathbf{S}'\Sigma_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\Sigma_h^{-1}$, where Σ_h is the h -step base forecast error covariance matrix.

$$\tilde{\mathbf{y}}_n(h) = \mathbf{S}(\mathbf{S}'\Sigma_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\Sigma_h^{-1}\hat{\mathbf{y}}_n(h)$$

Problem: Σ_h hard to estimate, especially for $h > 1$.

Solutions:

- Ignore Σ_h (OLS) [`min_trace(method='ols')`]
- Assume $\Sigma_h = k_h \Sigma_1$ is diagonal (WLS)
[`min_trace(method='wls')`]
- Assume $\Sigma_h = k_h \Sigma_1$ and estimate it (GLS)
[`min_trace(method='shrink')` (the default)]

Features

- Covariates can be included in initial forecasts.
- Adjustments can be made to initial forecasts at any level.
- Very simple and flexible method. Can work with *any* hierarchical or grouped time series.
- Conceptually easy to implement: regression of base forecasts on structure matrix.

Outline

- 1 Hierarchical and grouped time series
- 2 Forecast reconciliation
- 3 Example: Australian tourism
- 4 Lab Session 10

Example: Australian tourism

```
tourism_agg <- tourism %>%  
  aggregate_key(Purpose * (State / Region),  
               Trips = sum(Trips))  
fc <- tourism_agg %>%  
  filter_index(. ~ yearquarter("2015 Q4")) %>%  
  model(ets = ETS(Trips)) %>%  
  reconcile(ets_adjusted = min_trace(ets)) %>%  
  forecast(h = "2 years")
```

Example: Australian tourism

```
fc %>%
```

```
  filter(is_aggregated(Purpose) & is_aggregated(State)) %>%  
  autoplot(tourism_agg, level=95)
```

Example: Australian tourism

```
fc %>%  
  filter(is_aggregated(Purpose) & State=="Victoria" &  
         is_aggregated(Region)) %>%  
  autoplot(tourism_agg, level=95)
```

Example: Australian tourism

```
fc %>%
```

```
  filter(is_aggregated(Purpose) & Region=="Melbourne") %>%  
  autoplot(tourism_agg, level=95)
```

Example: Australian tourism

```
fc %>%
```

```
  filter(is_aggregated(Purpose) & Region=="Snowy Mountains") %>%  
  autoplot(tourism_agg, level=95)
```

Example: Australian tourism

```
fc %>%
```

```
  filter(Purpose=="Holiday" & Region=="Barossa") %>%
```

```
  autoplot(tourism_agg, level=95)
```

Example: Australian tourism

```
fc %>%
```

```
  filter(is_aggregated(Purpose) & Region=="MacDonnell") %>%  
  autoplot(tourism_agg, level=95)
```

Forecast evaluation

```
fc %>% accuracy(tourism_agg)
```

```

## 2 ets_adjusted 0.952
```

Outline

- 1 Hierarchical and grouped time series
- 2 Forecast reconciliation
- 3 Example: Australian tourism
- 4 Lab Session 10

Lab Session 10

- Create a new tsibble for PBS data using only ATC1 groups (combining over ATC2 groups).
- Use forecast reconciliation with this data, using both ETS and SNAIVE models.
- Which type of model works best?
- Does the reconciliation improve the forecast accuracy?
- Why doesn't reconciliation make any difference to SNAIVE forecasts?
